

ESD5500-II Fusion Series Speed Control Unit

See Section 12 for more dimensions

WIRING

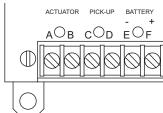

See Section 12 for the Wiring Diagram

TERMINAL	DEFINITION	NOTES			
A & B	ACTUATOR (+/-)	#16 AWG (1.3mm sq) or larger wire			
		Wires must be twisted and/or shielded for their entire length			
C & D	MAGNETIC SPEED PICKUP (D is ground)	Gap between speed sensor and gear teeth should not be smaller than 0.02 in. (.51mm)			
	, , ,	Speed sensor voltage should be at least 1V AC RMS during crank			
		#16 AWG (1.3mm sq) or larger wire			
E&F	BATTERY POWER (-/+)	A 15 amp fuse must be installed in the positive battery lead to protect against reverse voltage			
		Battery positive (+) input is Terminal F			
G	GROUND SIGNAL	Low current for switches & potentiometers			
Н	JUMPER INPUT	Add Jumper for 12V Battery or Actuator Currents Above 5A			
J	VARIABLE SPEED INPUT	0 - 5 VDC Input			
K&L	DROOP SELECT	Active When Closed			
М	IDLE SELECT	Close for Idle			
N	ACCESSORY INPUT	Load Sharing / Synchronizing Input			
P ACCESSORY POWER SUPPLY		10 Volt Output, 20 mA Max			

RECOMMENDATIONS

- Shielded cable should be used for all external connections to the ESD
- One end of each shield, including the speed sensor shield, should be grounded to a single point on the ESD case.

There are 3 LEDs to indicate actuator voltage output, magnetic speed pickup input signal, and battery

Low Current Act.

Low current actuators, also known as, "Light-Force", is for small actuators like the T1 ATB, ALR/ALN, and the 100/103/104 series actuators. Enable this switch for use with low current actuators.

NOTE

This must be set prior to startup. Contact GAC if you need to confirm your actuator selection

ESD5500-II Series Speed Control Unit 4.14 PIB2180 A

ADJUSTMENTS BEFORE ENGINE STARTUP

Make sure the following adjustments are set before starting the engine.

Gain	Middle Position
Stability	Middle Position
Speed	Middle Position
Start Fuel	Full CW (Maximum Fuel)
Speed/Fuel Ramp	Full CCW (Fastest)

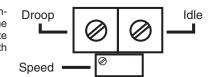

START THE ENGINE

The speed control unit governed speed setting is factory set at approximately engine idle speed. (1000 Hz., Speed sensor signal or 600 RPM)

Crank the engine with DC power applied to the governor system. The actuator will energize to the maximum fuel position until the engine starts. The governor system should control the engine at a low idle speed.

GOVERNOR SPEED SETTING

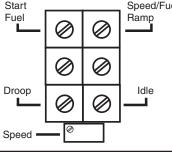

The governed speed set point is increased by clockwise rotation of the Speed adjustment control. Remote speed adjustment can be obtained with an optional 5K Speed Trim Control.

The Speed potentiometer is a 25 turn potentiometer

START FUEL & IDLE ADJUSTMENT

	START FUEL ADJUSTMENT			
1.	Place the engine in idle by connecting Terminals M & G and placing the external selector switch in the Idle position.			
2.	Adjust the Idle or operating speed for as low a speed setting as the application allows. (CCW turn to lower speed)			
3.	3. Adjust the Start Fuel CCW until engine speed begins to fall. Increase the Start Fuel slightly so that the idle speed is returned to the desired level.			
4.	Stop the engine.			
	Start Speed/Fuel Ramp			

Idle Speed

The Idle setting must be set to the desired speed. If the Idle speed setting was not adjusted as detailed above in "Start Fuel Adjustment" then place the optional external selector switch in the Idle position. The idle speed set point is increased by the clockwise rotation of the Idle adjustment control. When the engine is at idle speed, the speed control unit applies droop to the governor system to insure stable op eration.

OPERATION

One of two methods of operation for the ESD5500-II may be now selected.

METHOD 1	Start the engine and accelerate directly to the operating speed (Generator Sets, etc.).					
	Procedure					
	1.	Remove the connection between Terminals M & G.				
	2.	Start the engine and adjust the Speed/Fuel Ramp for the least smoke during acceleration to rated speed and to prevent overshoot				
	3.	If the starting smoke is excessive, adjust the Start Fuel slightly CCW.				
	4. If the starting time is too long, adjust the Start Fuel slightly					

METHOD 2

Start the engine and maintain at an idle speed for a period of time prior to accelerating to the operating speed. This method separates the starting process so that each may be optimized for the lowest smoke emissions.

Procedure Replace the connection between Terminals M & G with a switch, usually an oil pressure switch or toggle switch

- Start the engine.
- 3. If the starting smoke is excessive, the Start Fuel may need to be adjusted slightly CCW.
- If the starting time is too long, the Starting Fuel may need to be adjusted slightly CW.
- When the switch opens, adjust the Speed Ramping for the least amount of smoke when accelerating from idle speed to rated speed or to prevent overshoot.

NOTE The idle speed must be set below operation speed.

(8) ADJUSTING FOR STABILITY

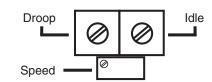

TROUBLESHOOTING.

Once the engine is running at operating speed and at no load, the following governor performance adjustments can be made to increase engine stability.

	STABILITY ADJUSTMENT						
	PA	RA	METER	PROCEDURE			
	A. Gain		1.	Rotate the Gain adjustment clockwise until instability develops.			
			2.	Then, gradually move the adjustment counterclockwise until stability returns.			
		3.	Finally, move the adjustment one division further counter- clockwise to insure stable performance (270° potentiometer).				
				4. If instability persists, adjust the next parameter.			
B. Stability 1. Follow the same adjustment procedure, steps 1 - 3, Gain parameter.		Follow the same adjustment procedure, steps 1 - 3, as the Gain parameter.					
	NO	NOTE Normally, adjustments made at no load achieve satisfactory performance. If further performance improvements are required, refer to Section (11) SYSTE					

ADDITIONAL FEATURES & OPTIONAL WIRING

Speed Droop Operation

Droop is typically used for the paralleling of engine driven generators. When in droop operation, the engine speed will decrease as engine load increases. The percentage of droop is based on the actuator current change from no engine load to full load.

- Place the optional external selector switch in the Droop position. Droop is increased by clockwise rotation of the Droop adjustment control.
- After the droop level has been adjusted, the rated engine speed setting may need to be reset. Check the engines speed and adjust that speed setting accordingly.

Though a wide range of droop is available with the nternal control, droop level requirements of 10% are unusual. If droop levels experienced are higher or lower than those required, contact GAC for assistance. Droop is based on a speed sensor frequency of 4000 Hz, and an actuator current change of 1 amp from no load to full load. Applications with higher speed sensor signals will experience less percentage of droop. Applications with more actuator currant change will experience higher percentages of droop. Protected against reverse voltage by a series diode. A 15 amp fuse must be installed in the positive battery lead. Protected against short circuit to actuator (shuts off current to actuator). unit automatically turns back on when short is removed.

Dither

Certain applications require a dither function to reduce sticking actuators in contaminated environments or increase stability. This switch can be used to add a small dither/frequency to the actuator output to prevent these occurences.

Accessory Input

The AUX Terminal N accepts input signals from load sharing units, auto synchronizers, and other governor system accessories, GAC accessories are directly connected to this terminal.

Terminal N is sensitive. Accessory connections must

When an accessory is connected to Terminal N, the speed will decrease and the speed adjustment must

When operating in the upper end of the control unit frequency range, a jumper wire or frequency trim control may be required between Terminals G and J. This increases the frequency range of the speed control to over 7000 Hz (4200 RPM).

If the auto synchronizer is used alone, not in conjunction with a load sharing module, a 3 ohm resistor should be connected between Terminals N and P. This is required to match the voltage levels between the speed control unit and the synchronizer.

Accessorv Supply

The +10 volt regulated supply, Terminal P, can be utilized to provide power to GAC governor system accessories. Up to 20 mA of current can be drawn from this supply. Ground reference is Terminal G

short circuit on this terminal can damage the speed control unit. Never jumper Terminal P directly to Terminal N.

Remote Variable **Speed Operation**

A single remote speed adjustment potentiometer can be used to adjust the engine speed continuously over a specific speed

Select the desired speed range and corresponding potentiometer value. (Refer to TABLE 1 below) If the exact range cannot be found, select the next higher range potentiometer.

An additional fixed resistor may be placed across the potentiometer to obtain the exact desired range. Connect the speed range potentiometer as shown in Section 12 using Terminals G and J.

To maintain engine stability at the minimum speed setting, a small amount of droop can be added using the DROOP adiustment. At the maximum speed setting the governor performance will be near isochronous, regardless of the droop adjustment setting.

CREED DANCE POTENTIOMETER

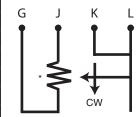

Contact GAC for assistance if difficulty is experienced in obtaining the desired variable speed governing performance

TABLE 1

SPEED	RANGE	VALUE
900 Hz 540 RPM		1 K
2400 Hz	1440 RPM	5 K
3000 Hz	1800 RPM	10 K
3500 Hz	2100 RPM	25 K
3700 Hz	2220 RPM	50 K

RPM values shown are for 100 teeth flywheel

MPU Signal (Hz) = RPM x Flywheel Teeth

Vibration

Testing

SYSTEM TROUBLESHOOTING

System Inoperative

If the engine governing system does not function, the fault may be determined by performing the voltage tests described in Steps 1 through 4. Positive (+) and negative (-) refer to meter polarity. Should normal values be indicated during troubleshooting steps, and then the fault may be with the actuator or the wiring to the actuator. Tests are performed with battery power on and the engine off, except where noted. See actuator publication for testing procedure on the actuator

				PROBABLE CAUSE OF		
STEP	WIRES	NORMAL READING		ABNORMAL READING		
1	F(+) & E(-)	Battery Supply Voltage (12 or 24 VDC)	1.	DC battery power not connected. Check for blown fuse, switch off power.		
			2.	Low battery voltage		
			3.	Wiring error		
2	C(+) & D(-)	1.0 VAC RMS min. while cranking	1.	Gap between speed sensor and gear teeth too great. Check Gap.		
			2. Improper or defective win the speed sensor. Resist between D and C should 160 to 1200 ohms. See smag pickup data for resistence.			
			3.	Defective speed sensor.		
3	P(+) & G(-)	10 VDC, Internal	1.	Short on Terminal P.		
		Supply	2.	Defective speed control unit.		
4	F(+) & A(-)	1.0 - 2.0 VDC while	1.	Speed parameter set too low		
		cranking	2.	Short/open in actuator wiring		
			3.	Defective speed control		
			4.	Defective actuator, see Actuator Troubleshooting		

If unsuccessful in solving instability, contact GAC for assistance. info@governors-america.com or call 413-233-1888

Instability

INSTABILITY	SYMPTOM	PROBABLE CAUSE OF ABNORMAL READING			
Fast Periodic	The engine seems to jitter with a 3Hz or	1.	Make sure switch #1 Lead Circuit is set to "OFF".		
	faster irregularity of speed.	2.	Readjust the Gain and Stability for optimum control.		
		3.	Turn off other electrical equipment that may be causing interference.		
		4.	Turn switch #5 Dither on/off.		
Slow Periodic	An irregularity of	1.	Readjust the Gain and Stability		
	speed below 3Hz.	2.	Adjust the Dead Time Comp by setting switch #4 to "ON".		
		3.	Check fuel system linkage during engine operation for: a. binding b. high friction c. poor linkage		
		4.	Turn switch #5 Dither on/off.		
Non-Periodic	Erratic Engine Behavior	1.	Increasing the Gain should reduce the instability but not totaly correct it. If this is the case, there is most likely a problem with the engine itself. Check for: a. engine mis-firings b. an erratic fuel system c. load changes on the generator set voltage regulator.		
		2.	If throttle is slghtly erratic, but perfor- mance is fast, then move switch #1 Lead Circuit to the "OFF" position.		
		3.	Turn switch #5 Dither on/off.		

DDOBABI E CALISE OF

Unsatisfactory Performance

SYMPTOM	ı	NORMAL READING		PROBABLE CAUSE OF ABNORMAL READING
Engine Over- speeds	1.	Do Not Crank. Apply DC power to the governor system.		After the actuator goes to full fuel, disconnect the speed sensor at Terminal C & D. If the actuator is still at full fuel-speed then the speed control unit is defective.
			2.	If the actuator is at minimum fuel position and there exists an erroneous position signal, then check speed sensor cable.
	2.	Manually hold the engine at the desired running speed. Measure the DC voltage between Terminals A(-) & F(+) on the speed control unit.	 2. 3. 	If the voltage reading is 1.0 to 1.5 VDC: a. Speed adjustment is set above desired speed b. Defective speed control unit If voltage reading is above 1.5 VDC then check for: a. actuator binding b. linkage binding If the voltage reading is below 0.8 VDC: a. Defective speed control unit

SYMPTOM	NORMAL READING		PROBABLE CAUSE OF ABNORMAL READING	
Actuator does not energize fully	1.	Measure the voltage at the battery while cranking.	1.	If the voltage is less than: a. 7V for a 12V system, or b. 14V for a 24V system, Then: Check or replace battery.
	2.	Momentarily connect Terminals A and F. The actuator should move to the full fuel position.	1. 2. 3.	Actuator or battery wiring in error Actuator or linkage binding Defective actuator
Engine remains below desired governed speed	1.	Measure the actuator output, Terminals A & B, while running under governor control.	1.	If voltage measurement is within 2 VDC of the battery supply voltage level, then fuel control is restricted from reaching full fuel position, possibly due to mechanical governor, carburetor spring, or linkage interference. Speed parameter set too low

Insufficient Magnetic Speed Signal

A strong magnetic speed sensor signal will eliminate the possibility of missed or extra pulses. The speed control unit will govern well with 1.0 volts RMS speed sensor signal. A speed sensor signal of 3 VAC or greater at governed speed is recommended. Measurement of the signal is made at Terminals C and D.

The amplitude of the speed sensor signal can be raised by reducing the gap between the speed sensor tip and the engine ring gear. The gap should not be any smaller than 0.020 in (0.45 mm). When the engine is stopped, back the speed sensor out by 3/4 turn after touching the ring gear tooth to achieve a satisfactory air gap.
